

Chapter 3 Processes

Thread Usage in Nondistributed Systems

Figure 3-1. Context switching as the result of IPC.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Thread Implementation

Figure 3-2. Combining kernel-level lightweight processes and user-level threads.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Multithreaded Servers (1)

Figure 3-3. A multithreaded server organized in a dispatcher/worker model.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Multithreaded Servers (2)

Model	Characteristics
Threads	Parallelism, blocking system calls
Single-threaded process	No parallelism, blocking system calls
Finite-state machine	Parallelism, nonblocking system calls

Figure 3-4. Three ways to construct a server.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

The Role of Virtualization in Distributed Systems

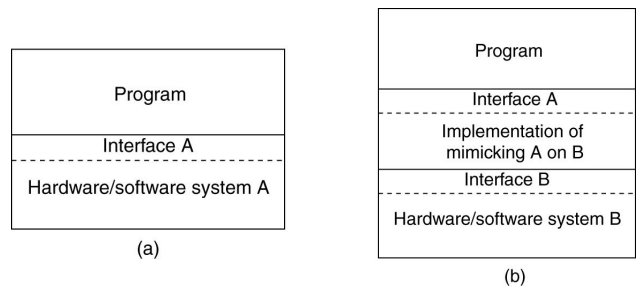

Figure 3-5. (a) General organization between a program, interface, and system. (b) General organization of virtualizing system A on top of system B.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Architectures of Virtual Machines (1)

Interfaces at different levels

- An interface between the hardware and software consisting of machine instructions
 - that can be invoked by any program.
- An interface between the hardware and software, consisting of machine instructions
 - that can be invoked only by privileged programs, such as an operating system.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Architectures of Virtual Machines (2)

Interfaces at different levels

- An interface consisting of system calls as offered by an operating system.
 - generally forming what is known as an application programming interface (API).
- An interface consisting of library calls
 - In many cases, the aforementioned system calls are hidden by an API.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Architectures of Virtual Machines (3)

Figure 3-6. Various interfaces offered by computer systems.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Architectures of Virtual Machines (4)

(a)

Figure 3-7. (a) A process virtual machine, with multiple instances of (application, runtime) combinations.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Architectures of Virtual Machines (5)

(b)

Figure 3-7. (b) A virtual machine monitor, with multiple instances of (applications, operating system) combinations.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Networked User Interfaces (1)

(a)

Figure 3-8. (a) A networked application with its own protocol.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Networked User Interfaces (2)

Figure 3-8. (b) A general solution to allow access to remote applications.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Example: The XWindow System

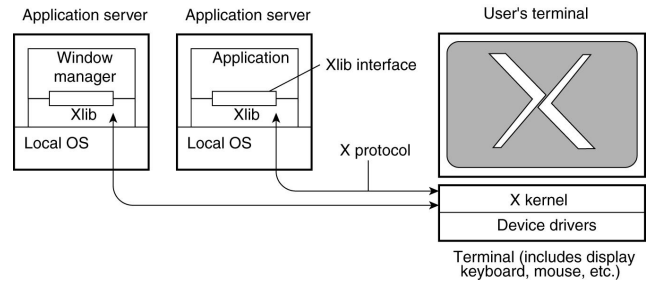

Figure 3-9. The basic organization of the XWindow System.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Client-Side Software for Distribution Transparency

Figure 3-10. Transparent replication of a server using a client-side solution.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

General Design Issues (1)

Figure 3-11. (a) Client-to-server binding using a daemon.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

General Design Issues (2)

Figure 3-11. (b) Client-to-server binding using a superserver.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Server Clusters (1)

Figure 3-12. The general organization of a three-tiered server cluster.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Server Clusters (2)

Figure 3-13. The principle of TCP handoff.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Distributed Servers

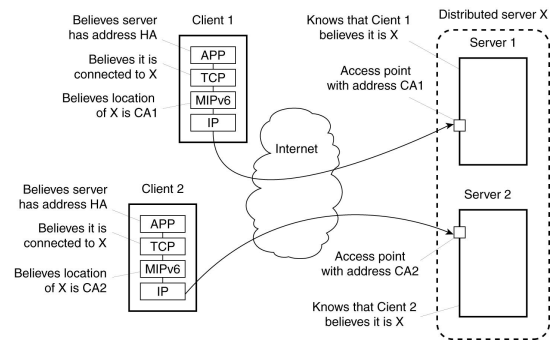

Figure 3-14. Route optimization in a distributed server.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Managing Server Clusters

Example: PlanetLab

Figure 3-15. The basic organization of a PlanetLab node.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

PlanetLab (1)

PlanetLab management issues:

- Nodes belong to different organizations.
 - Each organization should be allowed to specify who is allowed to run applications on their nodes,
 - And restrict resource usage appropriately.
- Monitoring tools available assume a very specific combination of hardware and software.
 - All tailored to be used within a single organization.
- Programs from different slices but running on the same node should not interfere with each other.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

PlanetLab (2)

Figure 3-16. The management relationships between various PlanetLab entities.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

PlanetLab (3)

Relationships between PlanetLab entities:

- A node owner puts its node under the regime of a management authority, possibly restricting usage where appropriate.
- A management authority provides the necessary software to add a node to PlanetLab.
- A service provider registers itself with a management authority, trusting it to provide well-behaving nodes.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

PlanetLab (4)

Relationships between PlanetLab entities:

- A service provider contacts a slice authority to create a slice on a collection of nodes.
- The slice authority needs to authenticate the service provider.
- A node owner provides a slice creation service for a slice authority to create slices. It essentially delegates resource management to the slice authority.
- A management authority delegates the creation of slices to a slice authority.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Reasons for Migrating Code

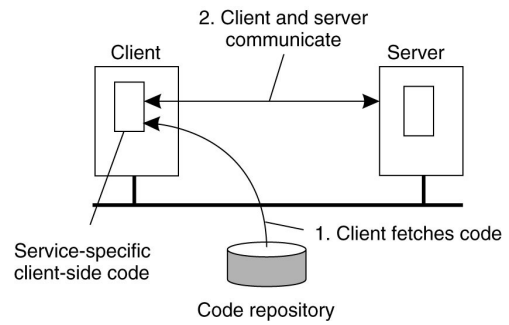

Figure 3-17. The principle of dynamically configuring a client to communicate to a server. The client first fetches the necessary software, and then invokes the server.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Models for Code Migration

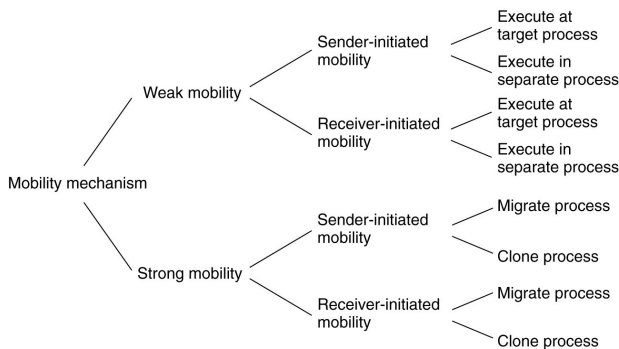

Figure 3-18. Alternatives for code migration.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Migration and Local Resources

		Resource-to-machine binding		
		Unattached	Fastened	Fixed
Process-to-resource binding	By identifier	MV (or GR)	GR (or MV)	GR
	By value	CP (or MV,GR)	GR (or CP)	GR
	By type	RB (or MV,CP)	RB (or GR,CP)	RB (or GR)

GR Establish a global systemwide reference
 MV Move the resource
 CP Copy the value of the resource
 RB Rebind process to locally-available resource

Figure 3-19. Actions to be taken with respect to the references to local resources when migrating code to another machine.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007

Migration in Heterogeneous Systems

Three ways to handle migration (which can be combined)

- Pushing memory pages to the new machine and resending the ones that are later modified during the migration process.
- Stopping the current virtual machine; migrate memory, and start the new virtual machine.
- Letting the new virtual machine pull in new pages as needed, that is, let processes start on the new virtual machine immediately and copy memory pages on demand.

Tanenbaum & Van Steen. Distributed Systems: Principles and Paradigms. 2e. (c) 2007
